Part a - Time analysis of Quick Sort

| Array Size | Time Elapsed | compCount | moveCount |
|------------|--------------|-----------|-----------|
| 16000 | 10 ms | 125517 | 424551 |

Part b - Time analysis of Insertion Sort

| Array Size | Time Elapsed | compCount | moveCount |
|------------|--------------|-----------|-----------|
| 16000 | 400 ms | 63383545 | 63399544 |

Part c - Time analysis of Hybrid Sort

| Array Size | Time Elapsed | compCount | moveCount |
|------------|--------------|-----------|-----------|
| 16000 | 10 ms | 113121 | 358223 |

Part a - Time analysis of Quick Sort

| Array Size | Time Elapsed | compCount | moveCount |
|------------|--------------|-----------|-----------|
| 18000 | 0 ms | 151199 | 507594 |

Part b - Time analysis of Insertion Sort

| Array Size | Time Elapsed | compCount | moveCount |
|------------|--------------|-----------|-----------|
| 18000 | 520 ms | 81426904 | 81444903 |

Part c - Time analysis of Hybrid Sort

| Array Size | Time Elapsed | compCount | moveCount |
|------------|--------------|-----------|-----------|
| 18000 | 10 ms | 137305 | 433110 |

Part a - Time analysis of Quick Sort

| Array Size | Time Elapsed | compCount | moveCount |
|------------|--------------|-----------|-----------|
| 20000 | 0 ms | 167711 | 563133 |

Part b - Time analysis of Insertion Sort

| Array Size | Time Elapsed | compCount | moveCount |
|------------|--------------|-----------|-----------|
| 20000 | 640 ms | 100631685 | 100651684 |

Part c - Time analysis of Hybrid Sort

| Array Size | Time Elapsed | compCount | moveCount |
|------------|--------------|-----------|-----------|
| 20000 | 10 ms | 152671 | 481734 |

Graphical Analysis

For quicksort, the worst case is $O(n^2)$, however, because of the number of elements and the speed of Dijkstra machine, algorithm has nearly a straight line. For the insertion sort, the worst case is $O(n^2)$ like quick sort. However, insertion sort is slower than quick sort, which means we can consider quick sort instead of insertion sort while working with vast number of elements. The hybrid sort, which is mix of quick sort and insertion sort, is pretty good with small number of elements, because it uses insertion sort when array size is less than or equal to 10. However, we have worked with big numbers and it cause the use of quick sort at the end, and if we looked at size 16000, we could see that their working time is equal.

Hybrid sort algorithm has advantages with small number due to work logic I mentioned above. However, at big size of arrays, it's running time should be same as quick sort. Hence, hybrid sort algorithm could be pretty useful when working with both small and big sized arrays.
